DR3 can be expressed in transformed host cells. These polypeptides can be used to treat diseases and disorders associated with the inhibition of apoptosis, or to screen for modulator compounds. Antagonists, such as antibodies raised against DR3-V1, can be used to treat diseases and disorders associated with increased apoptosis and for treating inflammatory diseases and disorders. Sequence 417 AA;	domain containing receptor DR3-V1 (see W31516) has also been identified. Recombinant full-length or mature DR3, or the overracellular transmembrages intracellular or death domain of	DR3, a novel member of the tumour necrosis factor receptor family. Its amino acid sequence was deduced from a cDNA clone (see T89427) isolated from a HUYEC cDNA library. Related death	to treat initalmmatory diseases Claim 1; Page 75-77; 108pp; English. This protein comprises human death domain containing receptor	Death domain containing receptor polypeptide(s) DR3 and DR3-V1 for activation of apoptosis and NF-kappaB, antagonists can be used		(UNMI) UNIV MICHIGAN. The invention provides nucleotide sequences encoding death domain containing receptor polypeptides DN3-V1 and DR3. The DR3-V1 CDNA clone is contained in ATCC deposition No. 97456 and the DR3 cDNA clone is contained in ATCC deposition No. 97757, Recombinant vectors comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           W95538 standard;

                                                                                                                                                                                                                                                                                                     the nucleic acid sequences and optionally the leader sequences are used for the recombinant production of the proteins. The present sequence represents the amino acid sequence of a death domain containing receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Death domain containing receptor polypeptide (DR3). Death domain; receptor; DR3-V1; DR3; recombinant.
                                                                                                                                                                                                                                   Sequence

This sequence is the human apoptosis inducing receptor (AIR) of the invention. AIR is a Type I transmembrane protein, soluble forms of which can be used to regulate cell death in a therapeutic setting. Soluble AIR can also be used in vitro to block apoptosis or AIR-expressing cells, or to screen agonists or antagonists of AIR activity. The cytoplasmic domain of AIR can be used to develop assays for inhibitors of AIR-induced cell death, which is useful to regulate cell death in a therapeutic setting as well as in vitro. Agonists of AIR activity can be used to kill tumour cells that express AIR, or T cells expressing AIR in autoimmune diseases. Sequence 417 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human apoptosis inducing receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Š
molecules comprising Apo-3 fused to a heterologous amino acid
c sequence; antibodies that bind to Apo-3 or its extracellular
domain; nucleic acids encoding the polypeptides, as well as
vectors and host cells; a non-human transgenic animal containing
c cells that express nucleic acid encoding Apo-3; and a non-human
knockout animal containing cells having an altered Apo-3 gene.
Apo-3 can be used to induce apoptosis or NF-kappa-B- (Nf-kB)- or
JNK-mediated gene expression for therapeutic purposes. Apo-3-IgG
fusion proteins can be used to inhibit apoptosis or NF-kB
induction or JNK activation for therapeutic purposes, and can
be used as immunogens for anti-Apo-3- antibody production.
Apo-3 or Apo-2LI can also be used as assay standards. The
animals can be used in drug screening and development.
                                                                                                                                                                                          in mammalian cells
Claim 19; Page 46-48; 70pp; English.
Claim 19; Page 46-48; 70pp; English.
This novel polypeptide, designated Apo-3, is a protein that stimulates or induces apoptotic activity in mammalian cells purposes. Its amino acid sequence was deduced from a human foetal heart cDNA clone (see T9180). The N-terminal 181 amino acids of Apo-3 are identical to the sequence of another novel apoptosis polypeptide, Apo-2LI (see W26709). Also claimed are: polypeptides comprising the extracellular or death domain of Apo-3; chimeric
                                                                                                                                                                                                                                                                                                                               Polypeptide(s) Apo-3 and Apo-2LI -

C This sequence represents the human death domain containing receptor-3

C DR3 which is used in a method resulting in the isolation of a human death domain containing receptor 4, DR4. DR4 agonists are used to increase apoptosis induced by tumour necrosis factor (TNF)-family ligands, e.g. in cases of cancer, autoimmune disease, viral or other infections, and inflammation, graft vs. host disease, acute or chronic graft rejection. Antagonists of DR4 are used to inhibit such apoptosis, e.g. in cases of acquired immune deficiency syndrome, neurodegenerative disease, acquired immune deficiency syndrome, neurodegenerative disease, cacquired immune deficiency syndrome, neurodegenerative disease, septic shock, cachexia and anorexia, also a wide range of inflammatory conditions. DR4 of fragments of the protein are used diagnostically, e.g. to detect mutant forms of DR4 (possibly associated with disease), for conditions of the DR4 gene or related sequences and for chromosomal mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (see T69426) isolated from a human testis tumour library. Related death domain containing receptor DR3 (see W31517) has also been identified. Recombinant full-length or mature DR3-VI can be expressed in transformed host cells. These polypeptides can be used to treat diseases and disorders associated with the inhibition of apoptosis, or to screen for modulator compounds. Antagonists, such as antibodies raised against DR3-VI, can be used to treat diseases and disorders associated with increased apoptosis and for diseases and disorders associated with increased apoptosis and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 1; Page 71-73; 108pp; I

The invention provides nucleotide sequences encoding death domain containing receptor polypeptides DR3-V1 and DR3. The DR3-V1 cDNA clone is contained in ATCC deposition No. 97456 and the DR3 cDNA clone is contained in ATCC deposition No. 97757. Recombinant vectors comprising the nucleic acid sequences and optionally the leader sequences are used for the recombinant production of the proteins. The present sequence represents the amino acid sequence of a death domain containing receptor polypeptide (DR3-V1).
DNA encoding apoptosis inducing receptor - which is Type I transmembrane protein, useful for regulating cell death claim 16; Page 33-35; 45pp; English.

This sequence is the mouse apoptosis inducing receptor (AIR) of the invention. AIR is a Type I transmembrane protein, soluble forms of w can be used to regulate cell death in a therapeutic setting. Soluble can also be used in vitro to block apoptosis or AIR-expressing cells
                                                                                                   Perkins

Claim 1; Page 43-44; 70pp; English.

This novel polypeptidede, designated Apo-2 ligand inhib (Apo-2LI), can be used to inhibit apoptosis for therape purposes. Its amino acid sequence was deduced from a h cDNA clone (see T91179) and is identical to amino acid 1-181 of another novel apoptosis polypeptide, Apō-3 (se W25709). It may be a soluble, truncated of secreted fo lacking some extracellular sequence as well as the tran

The cytoplasmic of AIR can be used to develop assays for inhibitors of AIR-induced death, which is useful to regulate cell death in a therapeutic sett well as in vitro. Agonists of AIR activity can be used to kill tume cells that express AIR, or T cells expressing AIR in autoimmune dis
                                                                                                                                                               in mammalian cells

Apo-2LI can be produced in host cells using a claimed method. Chimeric polypeptides comprising Apo-2LI fused to a heterologous amino acid sequence, and an Apo-2LI dimer are also claimed. Apo-2LI can be used to inhibit mammalian cell apoptosis in vivo or ex vivo, and in
                                                                                                                                                                                                                                                                                            extracellular receptor, transmembrane and death domains. The nucleic acid molecule which encodes the protein, it's encoded signal transduction protein and antibodies of the invention are useful in the diagnosis and treatment of neoplastic diseases. The invention is also useful for the production of animal model systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel human adriamycin-inducible killer protein located on chromosome 8p21, which also has p53-inducible, apoptosis-mediating activity and comprises an amino-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               induces apoptosis and is useful in neoplastic diseases

This sequence represents the human fas protein which is used in a method resulting in the isolation of a human death domain containing receptor 4, presulting in the isolation of a human death domain containing receptor 4.

DR4. DR4 agonists are used to increase apoptosis induced by tumour necrosis factor (TNF)-family ligands, e.g. in cases of cancer, autoimmune disease, viral or other infections, inflammation, graft vs. host disease, acute or chronic graft rejection. Antagonists of DR4 are used to inhibit such apoptosis, e.g. in cases of acquired immune deficiency syndrome, neurodegenerative disease, myelodysplastic syndrome, ischaemic injury, toxin-induced liver damage, septic shock, cachexia and anorexia, also a wide range of inflammatory conditions. DR4 of fragments of the protein are used diagnostically, e.g. to detect mutant forms of DR4 (possibly associated with disease), for isolating the DR4 gene or related sequences and for other and acceptances.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens. Schoolscure; Fig 91(1-2), 51pp; German.

CraTNF-R8 (Q06284) was used to screen the HS913T cDNA library.

ClambdaTNF-R2 encodes the complete human TNF-R2 and was used to construct a plasmid (pADTNF-R) expressing the product the same way as pADTNF-BP (see Q06282). The expressing the product the same way as pADTNF-BP (see Q06282). The expressing the product the same way as pADTNF-BP (see Q06282). The expressing the product the same way as pADTNF-BP (see Q06282). The expressing the product the same way as padTNF-BP (see Q06282). The expressing the product the damaging effects of TNF-alpha or -beta (e.g. infectious or parasitic diseases, shock, cachexia, autoimmune diseases, adult respiratory distress syndrome etc., or side effects of treatment with CTNG-alpha). They can also be used as diagnostic reagents for assaying TNF and in study of TNF-receptor interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

p55 TNF-R

TNF-R; human; murine; chimera;

```
CC This sequence represents human p55 tumour necrosis factor (TNF-R). CC This sequence represents human p55 tumour necrosis factor (TNF-R). CC Expression of this receptor is regulated by shedding of the extracellular CC contents, e.g. phorbol myristate acetate (PMA), depending on cell cinducing agents, e.g. phorbol myristate acetate (PMA), depending on cell cype. The only region of the receptor whose structure affects the CC shedding response is the spacer region (see R75012) in the extracellular CC domain. This region is located close to a site of cleavage of the CC molecule, and links the Cys rich module to the transmembrane domain. The CC spacer region of the encoded protein was used to create the chimeras between human p55 TNF-R and murine epidermal growth factor receptor CC (EGF-R) that are represented by R75007-11. This spacer region was CC subjected to deletion mutations (R75013-25) and substitutions CC (R75026-47). Of the spacer region, the most important residues are CC (R75026-47). Lys 174 and Gly 175, with Val 173 being the most conformation of these residues, with the exception of a limited CC dependence on the identity of Val 173. Mutations which alter the CC conformation of the protein adversely effect the shedding process. The mutations shown in R75013-47 were introduced in order to create an CC inhibitor of a protease that is capable of cleaving the soluble TNF-R CC from the cell bound TNF-R. Fragments of these inhibitors can be seen in CC sequence of Fragments of These protease inhibitors can be used for enhancing TNF function.
                                                                                                            Query Match

The sequences given in R42058-59 repressent human tumour necrosis factor receptor (TNF-R) and the sequences in R42060-61 represent human interleukin-1 receptor (IL-IR). These sequences were used the production of a fusion protein which conformed to one of the
The linker may comprise 5-100 amino acids selected from Gly, Asp, Ser, Thr and Ala. These linkers separate the individual moetities by such a distance that each component of the fusion protten is capable of folding into the secondary or tertiary structure requirements of the secondary or tertiary structure requirements biological activity. These fusion proteins may be used in
